```
CC (a) having 3 or more cysteine residues, where the mutated human IgG1 cimmunoglobulin hinge region polypeptide contains no more than one CC cysteine residue; and a mutated human IgG1 immunoglobulin hinge region CC polypeptide, derived from (a) having 3 or more cysteine residues; where CC the mutated human IgG1 immunoglobulin hinge region polypeptide contains CC capable of at least one immunological activity comprising antibody CC dependent cell-mediated cytotoxicity (ADCC) and complement fixation. The CC binding domain polypeptide is capable of specifically binding the construct comprising the polypucleotide of specifically binding the construct comprising the polypucleotide (operably linked to a promoter), a host cell transformed or transferted with a recombinant expression CC construct, producing the binding domain-immunoglobulin fusion protein, a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a construct, producing the binding domain-immunoglobulin fusion protein, a construct, producing the binding domain-immunoglobulin fusion protein, a construct, producing the binding domain-immunoglobulin fusion protein, a comprising the binding domain-immunoglobulin fusion protein, a compart of having a malignant condition or a B-cell disorder. CC thaving or suspected of having a malignant condition or a B-cell disorder, e.g. melanoma, carcinoma or sarcoma, rheumatoid arthritis, compasthenia gravis, Grave's disease, type I diabetes mellitus, multiple consumber therefore autoimmune disease. The present sequence is a binding domain immunoglobulin fusion protein-associated protein sequence. Note: The sequence data for this patent formed part of the printed specification comprised specification or compasted the sequences in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.

XX sequence 504 AA;

                                                                          The present sequence is the protein sequence of the heavy chain of a chumanised antibody of the present invention. In the variable portion, the complementarity determining regions (CDRs) originate from murine monoclonal antibody 10D5 and the framework region originates from human germine VH segment DP-28 and J segment JH4. Novel humanised antibodies of the invention have CDRs from 10D5 and human framework sequences. These humanised antibodies have binding affinities (affinity and epitope contained antibodies have binding affinities (affinity and epitope contained antibodies have binding affinities, the mouse 10D5 antibody. The invention includes antibodies, single chain antibodies, and their contained antibodies, and their contained antibodies antibody to treat, prevent, and methods of using the humanised antibody to treat, prevent, associated with Down's syndrome, (pre-)clinical Alzheimer's disease or (pre-)clinical cerebral amyloid angiopathy, and to inhibit formation or reduce Abeta plaque in the brain. (Updated on 23-OCT-2003 to standardise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Mus sp.

The antibody and its derivatives are useful in the diagnosis and therapy of tumours, particularly cancer diagnosis. The present sequence is a protein used in the exemplification of the invention

CC are useful for treating immune system diseases such as asthma, leukaemia are or their allergic or inflammatory diseases. Extracellular domains of (I) crepresent potential markers for screening, diagnosis, prognosis, follow-cc inhibit inflammation, tissue damage and remodeling in asthma, and cc inflammatory diseases such as allergic rhinitis, osteoarthritis, Crohn's cd disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is cc disease, psoriasis, rheumatoid arthritis, conjunctivitis, etc. (I) is cc also useful for monitoring the course of disease or disorders, and for cl dentifying agents that bind with and/or modulate the biological activity of SIGLEC-BMS proteins. The nucleic acid molecules (II) encoding (I) are useful in diagnosis and/or prognosis methods, and to detect the presence cc and/or amount of SIGLEC-BMS nucleotide sequences and/or SIGLEC-BMS proteins in a biological sample. (II) are useful as nucleic acid probes care useful for screening genomic library to isolate a genomic clone of SIGLEC gene. SIGLEC-BMS gene copy number is determined for detecting cd iseases or disorders associated with SIGLEC-BMS transcripts or proteins. The sIGLEC-BMS artibodies are also used to detect, sort or isolate cells expressing SIGLEC-BMS proteins and in diagnostic imaging technology. Calcium the college of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel isolated SIGLEC (sialic acid-binding Ig-related lectin) protein molecules useful for treating immune system diseases such as asthma, leukemia, allergic rhinitis, psoriasis, conjunctivitis, Crohn's diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 11; Fig 23; 209pp; English

                                                                                                                                                                         The invention relates to a novel binding molecule comprising at least one antigen binding site comprising in sequence the hypervariable regions CDR1, CDR2 and CDR3. The molecule of the invention has immunosuppressive, antipsoriatic, antiinflammatory, and antiallergic activity. The molecule of the invention is a CD45-Antagonist. The binding molecule or humanised antibody is useful as a pharmaceutical in the treatment of autoimmune diseases, transplant rejection, psoriasis, inflammatory bowel disease and allergies. The binding molecule has a binding specificity for both CD45RO and CD45RB in medicine, where the binding molecule is a chimeric, a humanised or a fully human monoclomal antibody. The sequence represents the heavy chain of the CD45RO/RB binding molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        267
```

The present sequence is a fusion protein comprising part of human VCAM-1 and the Fc region of human IgGI. The sequence encoding this protein was generated by integrating the VCAM-1 coding region into a plasmid designated pDEF24/IgGI, which encodes the hinge and constant CH2-CH3 domains of human IgGI. The sequence was then ligated to the expression vector pDEF24 and transformed into DH5a competent cells. The fusion protein was used as a control in adhesion experiments involving ACAM#4/IgG-Fc and ACAM#6/IgG4-Fc fusion proteins. ACAM#4 and ACAM#6 are

Nucleic acids encoding ACAM, a human cellular adhesion molecule, for diagnosing, preventing and treating diseases associated with expression and activity, e.g. epilepsy and schizophrenia.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            change foetal brain cDNA clones containing alternatively spliced full-
clength variants of a novel adhesion molecule designated ACAM. ACAM
culcic acids and polypeptides may be used in the prevention, treatment
and diagnosis of diseases associated with inappropriate ACAM expression
and activity such as dementia, epilepsy, schizophrenia, peripheral nerve
clinjuries and diabetic neuropathies. They may be used to rectify mutations
or deletions in a patient's genome that affect the activity of ACAM or to
supplement insufficient ACAM production in a patient. Conversely,
antisense nucleic acid molecules may be administered to down-regulate
ACAM expression. The nuclectide sequence may also be used as a DNA probe
in diagnostic assays (e.g. PCR) to detect and quantitate the presence of
similar nucleic acid sequences in samples, and hence determine which
patients may be in need of restorative therapy. ACAM polypeptides may be
used as antigens in the production of antibodies against ACAM and in
assays to identify modulators (agonists and antagonists) of ACAM
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Best Local Similarity Matches 264; Conserv

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to genetically engineered CD19-specific immune cells which express, and bear on the cell surface membrane, a CD19-specific chimeric receptor. The CD19-specific chimeric T cell receptor consists of: (a) an intracellular signaling domain selected from zeta, et and FcepsilonRI, for an effector function of the immune cell; (b) at least 1 transmembrane domain and (c) at least 1 extracellular domain comprising a CD19-specific receptor. The compositions and methods of the malignancies and for abrogating any untoward B cell function in autoimmune disorders such as lupus or rheumatoid arthritis. The present sequence represents a CD19:zeta chimeric immunoreceptor amino acid sequence. This chimeric receptor was constructed by PCR splice overlap extension and consists of human GM-CSF receptor alpha chain leader peptide, FM63 Vh, Gly-Ser linker, FM63 Vl, human IgG1 FC, human CD4

                                                                                                                                                                                                                                                                                                                                 The invention relates to treating cognitive symptoms or reducing disease progression in a subject having a condition or disease associated with amyloid-beta peptide (Abeta). The method involves administering an amount of an anti-Abeta antibody that has greater affinity for soluble Abeta than 10^-9 M, that has affinity (KD) for soluble Abeta-40 or Abetal-42 higher than 10^-9 M, or that has greater affinity for soluble Abeta than antibody 266 has. The method or the anti-Abeta antibody is useful in preparing a medicament for treating cognitive symptoms or reducing disease progression in a subject having a condition or disease associated with Abeta. The condition or disease is Alzheimer's disease, Down's syndrome, cerebral amyloid angiopathy, vascular dementia, or mild cognitive impairment. The present sequence represents a humanised anti-Abeta antibody 266 heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Treating or reducing the progression of diseases associated with amyloid-beta peptide, e.g. Alzheimer's disease, vascular dementia or mild cognitive impairment, comprises administering an anti-amyloid-beta
                                                                                                                                                                                                                                                                                           Sequence

```

The present invention relates to a method for effecting rapid improvement of cognition in a subject having a condition or disease related to the Abeta peptide. The method comprises administering an anti-Abeta antibody. The method is useful for treating cognitive impairments associated with Abeta peptide including those involved in Alzheimer's disease, Down's

improvement

Effecting rapid improvement of cognition in a subject having Alzheimer' disease, Down's syndrome, cerebral amyloid angiopathy, or mild cognitivimpairment, comprises administering anti-A beta antibody.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       syndrome, cerebral amyloid angiopathy, certain vascular dementia, and certain forms of mild cognitive impairment. The anti-Abeta antibody is useful for preparing a medicament for effecting rapid improvement in cognition in a subject having Alzheimer's disease, Down's syndrome, cerebral amyloid angiopathy, or mild cognitive impairment. The present sequence represents a preferred heavy chain for a humanised 266 antibody

This sequence represents the preferred heavy chain. The humanised antibody of the invention may be used for diagnosing preclinical or clinical Alzheimer's disease. The antibody specifically binds an epitope, preferably the amyloid beta peptide (Abeta). The antibodies sequester Abeta from its bound, circulating form in blood an alter clearance of soluble and bound forms of Abeta in central nervous system and plasma. The antibodies specifically bind an epitope representing amino acids 13-28 of the Abeta molecule

                                                                                                                                                                                                                                                                                                                                                           the first promoter-cistron pair comprises a first translational
cintilation region (TIR-L) operably linked to a nucleic acid sequence
encoding an Ig light chain and the second cistron of the second promoter-
cistron pair comprises a second translational initiation region (TIR-H)
coperably linked to a nucleic acid sequence encoding an Ig heavy chain.
Upon expression of the polynucleotide in a prokaryotic host cell, light
and heavy chains are folded and assembled to form a biologically active
If The antibody of the invention is useful for diagnosing, treating or
preventing diseases or conditions associated with abnormal expression and
/or activity of one or more antigen molecules e.g. lymphoid malignancies,
inflammatory, anglogenic, immunologic, neuronal, glial, astrocytal,
hypothalamic or other glandular disorders. The present sequence
crepresents the amino acid sequence of an anti-tissue factor (TP) heavy
chain fragment of the cistron vector paTF50

The present sequence is that of an anti-tissue factor (TF) antibody heavy chain including a heat stable enterocoxin II (STII) secretion signal. This recombinant heavy chain is produced by host cells transformed with claimed vector pxTF-7T3FL (see ABZ82072). The plasmid contains 2 translational units that temporally separate the transcription of the antibody light (see ABP72747) and heavy chains. Expression of the light chain is under the control of the phoA promoter, while expression of the heavy chain is under the control of the inducible TacII promoter. In an example from the invention, Escherichia coli 60H4 was transformed with pxTF-7T3FL. The light chain was expressed initially and secreted into the periplasmic space. Heavy chain production was then induced by addition of IPTG A yield of 2.6 +/- 0.3 g/l assembled F(ab')2 was obtained, compared

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with a yield of 1 g/l obtained using a single promoter system. This is example of the process of the invention for production of recombinant antibodies in a host cell system, with temporally separated expression the light and heavy chains. Properly assembled, soluble and functional antibodies (or their fragments) can be produced in high yields for diagnostic or therapeutic applications, including treatment of cancer of autoimmune diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

The invention relates to an isolated human monoclonal rabies virus neutralising antibody (virucide) derived from cDNA clones encoding the antibody heavy and light chains expressed in heterologous expression systems and purified away from deleterious contaminants. The invention provides a fused gene encoding a chimeric immunoglobulin light chain and a fused gene encoding a chimeric immunoglobulin heavy chain. The antibody of the invention is useful for treating an individual exposed to a rabies virus by administering to the individual a therapeutically effective amount of the antibody, and preventing a spread of the rabies virus to the central nervous system (CNS). The antibody of the invention provides a safe and efficacious post-exposure prophylactic therapy for individuals exposed to a rabies virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 474

The invention discloses a recombinant antibody comprising a constant region of monoclonal antibody (Mab) 57 linked to a non-Mab 57 variable region. Rabies is an acute, neurological disease caused by infection of the central nervous system with the rabies virus, a member of the Lyssavirus genus of the family Rhabdoviridae. Also disclosed are methods for producing an isolated recombinant antibody by culturing a host cell, containing a recombinant expression vector comprising the nucleic acid molecule encoding the antibody, and isolating the recombinant antibody expressed and treating an individual exposed to a pathogen by administering to the individual the recombinant antibody. The recombinant expressed to a pathogen, e.g. rabies infection. They are also useful for the sequences presented are the antibody protein fragments, the nucleic acids encoding them or the PCR primers used to construct the recombinant
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          426
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             384
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  366
```

The invention relates to a binding domain-immunoglobulin fusion protein CC comprising a binding domain polypeptide that is fused to an immunoglobulin hinge region polypeptide, an immunoglobulin heavy chain CC immunoglobulin hinge region polypeptide that is fused to the hinge region CC polypeptide, and an immunoglobulin heavy chain CH3 constant region CC polypeptide, and an immunoglobulin heavy chain CH3 constant region CC polypeptide that is fused to the CH2 constant region polypeptide. The hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; contains 2 cysteine residues, where the first cysteine is not mutated; a mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine is not mutated; a mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (b) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (c) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues; where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (b) having 3 or more cysteine residues. The binding domain-immunoglobulin fusion protein is New binding domain-immunoglobulin fusion protein, useful for treating subject having or suspected of having a malignant condition or a B-cel disorder, e.g. melanoma, Grave's disease or autoimmune disease. Disclosure; SEQ ID NO 398; 157pp; English. ating a B-cell

dependent cell-mediated cytocoxicity (ADCC) and complement fixation. The CC binding domain polypeptide is capable of specifically binding to an experience of the polymucleotide encoding the construct comprising the polymucleotide encoding the construct comprising the polymucleotide (operably linked to a promoter), a host cell transformed or transfected with a recombinant expression construct, producing the binding domain-immunoglobulin fusion protein, a producing the binding domain-immunoglobulin fusion protein, a composition comprising the binding domain-immunoglobulin fusion protein, a polymucleotide and a carrier, and treating a subject carrier or polymucleotide and a carrier, and treating a subject thaving or suspected of having a malignant condition or a B-cell disorder. The binding domain-immunoglobulin fusion protein is useful for treating a condition or a B-cell disorder. The inding domain-immunoglobulin fusion protein is useful for treating a condition or a B-cell disorder. The inding domain condition or a B-cell disorder. The inding domain fusion protein sequence is a binding domain condition or a B-cell disorder. The inding domain fusion protein sequence is a binding domain condition or a B-cell disorder. The protein sequence is a binding domain condition or a B-cell condition fusion protein-associated protein sequence. Note: The condition of the printed specification at the sequence in the printed specification by their SEQ ID number therefore none of the sequences can be explicitly identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Query Match

subject having or suspected of having a mali disorder, e.g. melanoma, Grave's disease or New binding domain-immunoglobulin fusion protein, useful for treating a subject having or suspected of having a malignant condition or a B-cell autoimmune disease

WPI; 2003-801317/75.

Disclosure; SEQ ID NO 240; 157pp; English.

Comprising a binding domain-lemnunoglobulin fusion protein comprising a binding domain-lemnunoglobulin hings region polypeptide, an immunoglobulin heavy chain comprising region polypeptide, an immunoglobulin heavy chain complete that is fused to the hinge region polypeptide, and an immunoglobulin heavy chain complete that is fused to the hinge region polypeptide that is fused to the hinge region polypeptide. Comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide comprises: a wild-type human IgG1 immunoglobulin hinge region polypeptide (contains 2 cysteine residues, where the first cysteine is of mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (a) having 3 or more cysteine residues, where the first cysteine is not mutated; a contains 2 cysteine residues where the first cysteine is not mutated; a contains 2 cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide, derived from (c) having 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin hinge region polypeptide contains con cysteine residues, where the mutated human IgG1 immunoglobulin hinge region cysteine residues, where the mutated human IgG1 immunoglobulin fluston protein is completed form (a) having 3 or more cysteine residues, where the mutated human IgG1 immunoglobulin fluston protein is capable of at least one immunological activity comprising antibody capable of at least one immunological activity comprising antibody. The complete contains a cysteine residues in munoglobulin fluston protein is construct comprising the polymucleotide is capable of specifically binding to an antigen. Also included are an isolated polymucleotide encoding the binding domain polypeptide is capable of specifically binding to a promoter), a host cell transformed or transferted with a recombinant expression construct comprising the binding domain munoglobulin fluston protein, a construct comprising the binding domain and treating a subject having or suspected of having a malignant c

New antibodies which bind and neutralise interferon-gamma (IFN gamma) can come used as a medicant, for preventing or treating septic shock, cachexia, commune diseases including multiple sclerosis and Crohn's disease and skin compared in the comparation of the disorders including bullous, inflammatory and neoplastic dermatoses. The cantibody is selected from a single chain antibody (scFV), a chimeric cantibody or diabody comprising the humanised variable domain of the cor a ruminant antibody. The antibody B9D10; a multivalent antibody; cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining cor a ruminant antibody. The antibodies are also useful for determining constant constant collaborate manual flag and a bample. Two fusion collaborate complement binding suther constant region. The heavy chain variable domain and a human comprised collaborate pour overlapping synthetic oligonucleotides (AAX08595) to generate pour overlapping synthetic oligonucleotides (AAX08590) to generate pour overlapping synthetic oligonucleotides (AAX08591) to amplified from poemic synthetic oligonucleotides (AAX08591) to applie to a two primers (AAX08591) and then cloned to repeat the complete

The antibody is selected from a single chain antibody (scFv), a chimeric antibody or diabody comprising the humanised variable domain of the monoclonal mouse anti-IFN gamma antibody D9D10; a multivalent antibody; or a ruminant antibody. The antibodies are also useful for determining IFN gamma levels in a sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New engineered antibodies which bind and neutralise interferon-gamma - useful for prevention and treatment of septic shock, cachexia, immune diseases and skin disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 711 AA;
